

Maryam Rashid

Professional Portfolio

Introduction

About me

- Hi, I'm Maryam Rashid, a Software Engineering student passionate about Artificial Intelligence, Machine Learning, and Data Analytics. I enjoy building intelligent systems, analyzing data to uncover insights, and developing software solutions that solve real-world problems.
 - My interests include AI/ML, data analytics, cybersecurity, backend development, and data structures & algorithms. I've worked on projects ranging from phishing detection systems using Python and machine learning to automation workflows and custom backend prototypes built with advanced data structures.
 - I'm skilled in Python, Java, SQL, and analytical problem-solving, and I enjoy combining technical knowledge with creativity to design efficient and impactful solutions. I'm always exploring new technologies, improving my development skills, and learning how data and AI can be used to create smarter systems.
-

Educational Background and Skills

Intermediate

2021 - 2023

Completed Intermediate from Excellence Education System, while securing 1st position in the entire division (BISEH), 2023

STEM Undergrad

2023 - 2027

Currently an undergrad pursuing studies in Software Engineering from Mehran University of Engineering and Technology.

AI Essentials Certificate

Google

Completed the Google AI Essentials Certificate, which gave a strong foundation in artificial intelligence concepts, including how AI systems work, how they are applied in real-world scenarios, and how to use AI tools responsibly and effectively.

Data Analytics

Cisco Networking Academy

Also earned a Data Analytics Certificate from Cisco Networking Academy, learning the fundamentals of data analysis, including data collection, cleaning, visualization, and interpretation.

Personal Skills

A quick snapshot of my core strengths, shown through self-assessed proficiency levels in key areas like Python, data analytics, and problem-solving. This section highlights my continuous progress and confidence in applying these skills to real-world tasks.

Ai/Machine Learning
(Python)

Data Analytics

Problem-Solving

Projects

PhishEye – Phishing Detection System (Python, Machine Learning):

Built a phishing URL detection system using machine learning techniques on structured datasets. Handled feature extraction, preprocessing, and data cleaning to improve prediction accuracy and model reliability. Trained and evaluated multiple classification models, optimizing their performance for practical cybersecurity use cases and real-world attack patterns.

Projects

BrightCart Online – E-Commerce Backend Prototype (Data Structures & Algorithms):

Developed a custom e-commerce backend prototype by implementing core data structures such as linked lists, stacks, queues, binary search trees, hash maps, and graphs from scratch. Designed features including a browsing carousel with cycle detection, an undo-enabled shopping cart using stack logic, and a priority-based order processing system. Built a customer management module with graph-based product recommendations to simulate real-world backend operations.

Projects

WordPress E-commerce Website:

Designed and developed a fully functional e-commerce website using WordPress. Configured themes, plugins, product management, and checkout workflow. Focused on responsive design and user-friendly interface.

Projects

Inventory Data Warehouse System (SQL Server + ETL + Data Analytics):

Built a comprehensive inventory and retail sales data warehouse system using Microsoft SQL Server to support business analytics and reporting. Designed fact and dimension tables using star schema modeling and implemented ETL processes for data extraction, transformation, and loading from raw datasets. Applied data cleaning, indexing, and aggregation techniques to optimize query performance and improve analytical efficiency. Generated realistic transactional datasets and developed analytical queries to track inventory, sales trends, returns, and business performance for data-driven decision-making.

Automation Projects

RAG Pipeline & Workflow (n8n + Embeddings + Vector Database):

Developed a Retrieval-Augmented Generation (RAG) pipeline within n8n by combining embeddings, vector storage, and an AI chat model. Converted documents into embeddings using a Hugging Face model and stored them in a Pinecone vector database for semantic search. Enabled the AI agent to retrieve relevant contextual information before generating responses, improving factual accuracy and reducing hallucinations in AI outputs.

Customer Support Workflow (n8n + AI Agent + Gmail Integration):

Built an AI-driven customer support automation workflow that processes incoming emails via Gmail triggers. Implemented text classification to route queries and used an AI agent to generate context-aware responses. Integrated structured memory and vector storage to improve reply relevance and consistency. Automated email responses while maintaining fallback logic for non-support queries, significantly reducing manual handling time.

Social Media Content Scheduler (n8n + Google Sheets + Automation):

Built an automated content scheduling workflow using n8n to manage and streamline digital content publishing processes. Implemented automated triggers and workflow logic to organize, schedule, and monitor content tasks efficiently. Integrated notification handling and task automation to reduce repetitive manual work and improve workflow consistency. The system enhanced productivity by automating content management operations and ensuring timely execution of scheduled publishing activities.
